

# COE 158 Introduction to IT

Introduction to Information Technology

# Introduction...

*“Man is still the most  
extraordinary computer of all”*

John F. Kennedy

# Lecture Outline

- What is Information Technology?
- Who Studies It?
- IT Infrastructure
  - Computers
  - Software
  - Users
  - Our View Today

# IT Roles

| Role                          | Job/Tasks                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Administrator</b>   | Administer the computers in an organization; install software; modify/update operating system; create accounts; train users; secure system; troubleshoot system; add hardware |
| <b>Network Administrator</b>  | Purchase, configure and connect computer network; maintain computer network; troubleshoot network; secure network from intrusion                                              |
| <b>Database Administrator</b> | Install, configure and maintain database and database management system; back up database; create accounts; train users                                                       |
| <b>Web Administrator</b>      | Install, configure and maintain web site through web server; secure web site; work with developers                                                                            |
| <b>Web Developer</b>          | Design and create web pages and scripts for web pages; maintain web sites                                                                                                     |
| <b>Security Administrator</b> | Install, configure and administer firewall; create security policies; troubleshoot computer system (including network); work proactively against intrusions                   |

# System Administration

- Account management
- Password management
- File protection management
- Installing and configuring new hardware
- Troubleshooting hardware
- Installing and configuring software
- Updating software
- Providing documentation and support
- System-level programming (scripting)
- System-level security
- IT Support
  - Documentation, manuals, website support (wikis, FAQs), A/V demos
  - Training
  - Help desk support

# Skills for the Successful IT Person

| Skill                                   | Description                                                                                                                                                                             | Example(s)                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Troubleshooting, problem solving</b> | <ul style="list-style-type: none"><li>• Detect a problem</li><li>• Diagnose its cause</li><li>• Find a solution (means of fixing it)</li></ul>                                          | <ul style="list-style-type: none"><li>• Poor processor performance</li><li>• Disk space full</li><li>• Virus or Trojan horse infection</li></ul> |
| <b>Knowledge of operating systems</b>   | <ul style="list-style-type: none"><li>• Operating system installation</li><li>• Application software installation</li><li>• User account creation</li><li>• System monitoring</li></ul> | <ul style="list-style-type: none"><li>• Versions of Linux</li><li>• Versions of Unix</li><li>• Windows</li><li>• Mac OS</li></ul>                |
| <b>System level programming</b>         | <ul style="list-style-type: none"><li>• Shell scripts to automate processes</li><li>• Manipulating configuration files for system services</li></ul>                                    | <ul style="list-style-type: none"><li>• Bash, Csh scripts</li><li>• DOS scripts</li><li>• Ruby scripts</li><li>• C/C++ programs</li></ul>        |

# Continued

| Skill                  | Description                                                                                                                                                                       | Example(s)                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System security</b> | <ul style="list-style-type: none"><li>• Ensuring proper system security is in place</li><li>• Following or drafting policies for users</li><li>• Monitoring for threats</li></ul> | <ul style="list-style-type: none"><li>• Configuring a system firewall</li><li>• Installing antiviral/anti-malware software</li><li>• Examining log files for evidence of intrusion and system security holes</li><li>• Keeping up with the latest security patches</li></ul> |
| <b>Hardware</b>        | <ul style="list-style-type: none"><li>• Installing and configuring new hardware</li><li>• Troubleshooting, replacing or repairing defective hardware</li></ul>                    | <ul style="list-style-type: none"><li>• Replacing CPUs and disk drives</li><li>• Connecting network cables to network hubs, switches, routers</li></ul>                                                                                                                      |

# Be Prepared

- Keep up with new trends in technology
  - Be a self-starter
  - Be curious
  - Be willing to learn on your own
- You might be on call 24/7
- Behave ethically at all times
  - Know the difference between ethical and unethical behavior

# Continued

## What is Information ?

## Continued

- **Information** is any knowledge that can be communicated, including abstract ideas and concepts
- The objects we represent can be either physical objects from the real world, such as products in an inventory, abstract objects e.g. mathematical construct

Continued

## • What is Technology ?

- **Technology** is application of scientific knowledge for practical purpose
- Using scientific knowledge to store, retrieve and manipulate data using computers

In your own words what is information technology?

# Continued

## • What is data ?

- **Data** is information in a form that the computer can use, for example, numbers, letters, and symbols.
- **Data** come in many different forms: letters, words, integer numbers, real numbers, dates, times, coordinates on a map, and so on.
- **Data** is unprocessed information

# What is a Computer?

- Electronic device
  - General purpose (executes any type of program)
  - Stores data
  - Performs the Input-Processing-Output-Storage (IPOS) Cycle
  - **A programmable device that can store, retrieve, and process data.**
- Examples:
  - Supercomputers
  - Mainframes/minicomputers
  - Personal computers/laptops
  - Notebook computers
  - Handheld devices
- What about these
  - Smart phones
  - Mp3 players
  - Electronic book readers
  - GPS

# Components of a Computer

- Processor
- Storage
  - Short term (memory)
    - SRAM
    - DRAM
    - ROM
  - Long term
    - Hard disk
    - Optical disk
    - Floppy disk
    - Flash drive
    - Magnetic tape
- I/O devices
- The system unit
- The motherboard, which contains
  - The CPU
  - CPU cooling unit
  - Extra processors (optional)
  - Memory chips for RAM, ROM
  - Connectors (ports) for peripherals
  - Expansion slots for peripheral device cards
  - ROM BIOS (booting, basic input & output instructions)
  - Power supply connector
- Disk drives
- Fan units
- Power supply

# Storage Sizes

| Size           | Meaning           | Example                                                                                                                                               |
|----------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 bit          | A single 0 or 1   | Smallest unit of storage, might store 1 black & white pixel or 1 true/false value, usually we have to combine many bits to create anything meaningful |
| 1 byte<br>(1B) | 8 bits            | We might store a number from 0 to 255 or -128 to 127, or a single character (letter of the alphabet, digit, punctuation mark)                         |
| 1 word         | 32 or 64 bits     | One piece of data such as a number or a program instruction                                                                                           |
| 1KB            | 1024 bytes        | We might store a block of memory in this size                                                                                                         |
| 1MB            | ~1 million bytes  | A small image or a large text file, an mp3 file of a song might take between 3 and 10 MB, a 50 minute tv show highly compressed might take 350MB      |
| 1GB            | ~1 billion bytes  | A library of songs or images, dozens of books, DVD requires several GB of storage (4-8GB)                                                             |
| 1TB            | ~1 trillion bytes | A library of movies                                                                                                                                   |

# I/O Devices (Peripherals)

# Software

- Programs
- Step-by-step instructions to the computer
- To run the program, the program must be written in the computer's machine language
- We write programs in high level languages
  - C/C++, Java, Python, Ruby, C#, Visual Basic, etc
- We translate programs from high level to machine language using language translator programs
  - compilers, interpreters, assemblers

# Example Program

- Compare 2 numbers and output the larger
- In English:
  - Input number1
  - Input number2
  - Compare the two numbers
  - If the first is greater than the second
  - Then output number1
  - Otherwise output number2

- In C code:

```
scanf("%d", &number1);  
scanf("%d", &number2);  
if(number1 > number2)  
    printf("%d is greater", number1);  
else printf("%d is greater", number2);
```

# Users

- Initiates the processes that computers run
- Uses interactivity
  - Makes computer usage more enjoyable
- Early users were engineers and programmers of the computers
- That changed in the 60s
- Today, nearly everyone is a user

# Computers Today

- Computers were easily identifiable
  - Expensive
  - Required clean room environments
  - People connected to them via network and terminals
- Not so today
  - Computers of any size
  - Wireless provides Internet access
  - Go anywhere and still have access
  - Billions of processors in our world

5MB Computer in 1956

500GB Computer

# Computer Hardware

- Microprocessor – the CPU on 1 chip
  - Pins on one side to plug into motherboard CPU slot
  - Cooling unit sits on top
- Memory – individual chips placed on circuit board
  - Slip circuit board into memory slot(s)
- System bus – part of the motherboard

# System Unit

- Case into which
  - You place the motherboard
  - Fan(s)
  - Disk drive units
  - Power supply
  - Internal MODEM connected to motherboard directly
- Peripheral devices connect to motherboard through ports in system unit

# Motherboard Explained

# System Unit

Insert motherboard to rest on top of standoffs

Screw holes for standoffs

# Hard Drive

Multiple platters

1 read/write head  
per surface

All disks spin in unison  
by central spindle

IDE (below) and SATA (below  
to the right) use different  
connectors

# Power Supply

Cables connect to drives, fan and motherboard

# Computer Assembly

- Prepare system unit
  - Identify the components to assemble
  - Remove system unit side panel
  - Screw in standoffs
- Prepare motherboard
  - Wear grounding strap
  - Insert CPU
  - Use a dab of thermal energy paste
  - Attach cooling unit to CPU and plug in to motherboard
  - Attach memory circuit board(s)

# CPU Cooling Unit

Place a “pea-sized” dab of heat paste on the surface of the CPU

Cooling unit “bolts” inserted into holes around CPU

Plug cooling unit’s power connector into motherboard socket

# Finish System Unit

- Insert disk drive unit(s)
  - Remove from bezel panel for optical drive but not for hard disk drive(s)
- Insert power supply unit into system unit
- Connect power supply cables to
  - Hard disk drive(s)
  - Optical disk drive
  - Motherboard LED panel
  - Fan
- Plug in external power cord to power supply unit, power on computer, does it boot?
  - When done, reinsert system unit panel

# Insert Disk Drive(s) Into Slot(s)

- Disk drive bays may have rails otherwise slip rails to sides of drive(s)
- Slide disk drive into empty bay in system unit
- Best to place drives as far toward the top of the system unit as available
